This clone is from an A. gambiae BAC library (ND-TAM) provided by F.H. Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M University BAC Center University. College Station, Texas 77843-2123, USA using a HindIII

Clones were picked by a O-bot after blue/white selection (ampicillin resistance - use 100 micrograms/microliter). Developed from a pool of equal amounts of RNA from developing embryos sampled at 14, 21, 28 and 35 days after pollination of the Illhois High Oil Maize Strain Cycle 90. This closed strain has been selected for high oil concentration for 90 generations and originates from the 1890s era open pollinated variety Burr's White" 68 g 72 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /cultivar="Illinois High Oil"

The invention comprises the amino acid and coding sequence of the PP-7 Porphyromonas gingivalis dipeptidylpeptidase 7 (PPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidglepptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present amino acid sequence represents an active site region of the Porphyromonas gingivalis dipeptidylepptidase-7 (DPP-7)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                Novel isolated dipeptidylpeptidase useful for identifying inhibitor the dipeptidylpeptidase for protecting an animal from periodontal disease caused by Porphyromonas gingivalis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dipeptidylpeptidase-7; DPP-7; enzyme; amidolytic cleavage; DPP-7 inhibitor identification; periodontal disease; gingi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                            The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidylpeptidase-7 (PPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present amino acid sequence represents the C-terminal region of the Staphylococcus aureus V8 endopeptidase enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       C-terminal region of the Porphyromonas (DPP-7) enzyme.
                                                                                                                                                                                                                                                                                           Novel isolated dipeptidylpeptidase useful for identifying inhibitor the dipeptidylpeptidase for protecting an animal from periodontal disease caused by Porphyromonas gingivalis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Staphylococcus aureus.

                                                                                                                                                                                                                                                                         A fusion protein, V8D (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature V8 protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli OmpT protease to yield active V8 protease. Extension of the C-terminal end of the V8 moiety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of

                                                                                                                                                                                                                                                                                                                                                                                                                                        A fusion protein, V8D (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature V8 protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli OmpT protease to yield active V8 protease. Extension of the C-terminal end of the V8 moiety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of
                                                                                              Linker peptide; V8 protease; Staphylococcus aureus; recombinant protein; fusion protein; beta-galactosidase; Escherichia coli; transposon Tn903;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prodn. of recombinant polypeptide(s) - using host cells transformed with a gene coding for the desired polypeptide fused to a protective polypeptide \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A fusion protein, V8D (AAR91035), has the formula A-L-B-L-C, where A and C are protective polypeptides, B is Staphylococcus aureus mature V8 protease lacking the C-terminal repeat region, and L is a linker (AAR91032). It was produced as an inclusion body in Escherichia coli host cells, and was cleaved using the E. coli OmpT protease to yield active V8 protease. Extension of the C-terminal end of the V8 molety of the fusion protein by 1, 2 or 3 amino acids (AAR91042-44) i.e. up to residue Phe-215, also resulted in the formation of inclusion bodies in E. coli. Any further extension gave a soluble product which exhibited protease activity that repressed growth of

Fusion proteins (AAR91033 and AAR91034) were constructed comprising an Escherichia coli beta-galactosidase derivative (protective polypeptide) fused at its C-terminal end to the S. aureus mature V8 protease without or with the repeat region. The constructs were inserted into vector pG97S4DhCT(G)R6, yielding pV8RPT(-) and

The DNA sequences encoding these proteins were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.

      The invention relates to new mutant staphylococcus aureus V8 proteases which have enzyme activity even under environmental conditions which promote protein denaturation. The mutants are based on 3 truncated V8 proteases lacking 48 (AAW22218), 56 (AAW22219) or 53 (AAW22220) amino acids from the C-terminal of the wild type protease. The mutants also contain amino acid substitutions, especially D44E, N71S and/or R147K. The protein sequence shown here represents a chimaeric protein comprising a truncated Staphylococcus aureus V8 protease lacking the prepro and C-terminal 48 amino acids linked, via a synthetic linker, downstream of the E. coli beta-galactosidase. The S. aureus portion of the chimaera was amplified by the primers AAT73254-5 from wild type sequence. The coding sequence was then used to generate mutants of the V8 protease which retain their levels of activity in the presence of a chimaera concentration of protein denaturant e.g. 5 M urea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                 The sequences given in AAR26842 and AAR29644 are proteases which were isolated from Staphylococcus aureus strains. The DNA sequences encoding these proteins were isolated by PCR using the primer sequences given in AAQ27960-86. The protease specifically cleaves the peptide bond at the C-terminus of the glutamic acid residue in polypeptide.

                                                                                                                                                                                                                      Fusion proteins (AAR91033 and AAR91034) were constructed comprising an Escherichia coli beta-galactosidase derivative (protective polypeptide) fused at its C-terminal end to the S. aureus mature V8 protease without or with the repeat region. The constructs were inserted into vector pg97S4DhCT(G)RG, yielding pv8RPT(+) and pv8RPT(+), respectively. Both constructs yielded active protease when expressed in E. coli JM101 transformants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Key
Region
     Linker peptide; V8 protease; Staphylococcus aureus; recombinant protein; fusion protein; beta-galactosidase; Escherichia coli; transposon Tn903; aminoglycoside 3'-phosphotransferase.

The fusion protein is expressed in inactive form in E. coli. It is then recovered, solubilised and cleaved at the linker peptide regions with a protease intrinsic to the host cells, i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric Chimeric Chimeric Chimeric Chimeric

                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to new mutant Staphylococcus aureus V8 proteases CC which have enzyme activity even under environmental conditions which CC promote protein denaturation. The mutants are based on 3 truncated V8 CC proteases lacking 48 (AAW22218), of 5 (AAW22219) or 53 (AAW22220) amino CC contain amino acid substitutions, especially D44E, N715 and/or R147K. CC The protein sequence shown here represents a chimaeric protein CC comprising a truncated Staphylococcus aureus V8 protease lacking the CC prepro and C-terminal 56 amino acids linked, via a synthetic R6 linker, CC downstream of the E. coli beta-galactosidase. Also included downstream of the Protease fragment is a second R6 linker and a fragment of the CC aminoglucoside 3'-phosphotransferase protein. The chimaeric sequence CC was generated by restriction digestion and ligation from the V8RPT(-) CC sequence (see AAW22218) by using a natural EcoRV site which removed a CC further 8 amino acid from the C-terminus. This truncated V8 protease, cold designated V8D, retains its level of activity in the presence of a cc higher concentration of protein denaturant e.g. 5 M urea.
                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                             Query Match

The invention relates to new mutant Staphylococcus aureus V8 proteases CC which have enzyme activity even under environmental conditions which CC promote protein denaturation. The mutants are based on 3 truncated V8 proteases lacking 48 (AAW22218), 56 (AAW22219) or 53 (AAW22220) amino CC acids from the C-terminal of the wild type protease. The mutants also contain amino acid substitutions, especially D44E, N71S and/or R147K. The protein sequence shown here represents a chimaeric protein CC comprising a truncated Staphylococcus aureus V8 protease lacking the preprior and C-terminal 53 amino acids linked, via a synthetic R6 linker, CC downstream of the E. coli beta-galactosidase. Also included downstream of the V8 protease fragment is a second R6 linker and a fragment of the C aminoglucoside 3'-phosphotransferase protein. The chimaeric sequence was generated by restriction digestion and ligation from the V8RPT(-) CC sequence (see AAW22218) by using a natural EcoRV site which removed a further 8 amino acid from the C-terminus. This truncated V8 protease, designated V8F, retains its level of activity in the presence of a higher concentration of protein denaturant e.g. 5 M urea.
                                                                                                         Matches
                                                                                                                                  Query Match

(DPP-7) enzyme. The DP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontitis). The present amino acid sequence represents the Porphyromonas gingivalis dipeptidylpeptidase-7 (DPP-7) enzyme of the
